

# Rainforest Packet Quick Preview

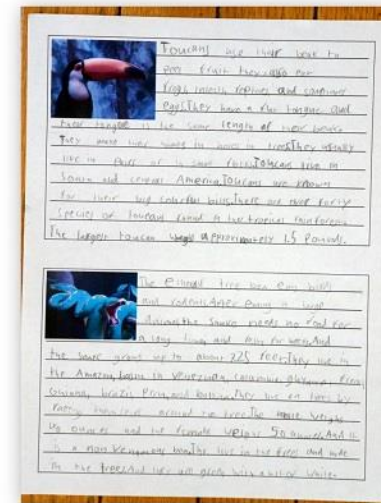

# Animals of the Amazon

**Since we homeschoolers often have kids of different ages, I have provided both research/writing paper as well as tracing pages with basic animal facts.**

### Amazon Rainforest Animals Fun Fact Pages!

# Rainforest Insects

Name: \_\_\_\_\_

## Rainforest Insects

The rainforest \_\_\_\_\_ is where the greatest abundance of species of insects can be found. Insects are almost inseparable from \_\_\_\_\_ because they require each other to survive. In the Amazon, most species of plants have only one species of moth or beetle to pollinate them successfully. Many insect species only live on a few acres range which makes them vulnerable to \_\_\_\_\_.

The Amazon rainforest may house as many as \_\_\_\_\_ species of insects, although only a tiny fraction of this number has been described by scientists. Some scientists estimate that \_\_\_\_\_ % of the animal biomass of the Amazon Basin is made up of \_\_\_\_\_.

One tree was home to more than \_\_\_\_\_ different species of beetles!

There are \_\_\_\_\_ species of butterfly in the rainforest compared to 20,000 worldwide.

**Titan Beetle:** (Pictured right) is the largest of all beetles. It can grow to be more than \_\_\_\_\_ inches. It can fly, but it can't get into the air from the ground. It has to climb trees and launch itself into the air.

**Goliath Bird-eating Spider:** Goliath \_\_\_\_\_-eating Spider is the largest spider in the world. It is one of the \_\_\_\_\_.

Name: \_\_\_\_\_

## Insects of the Rainforest

- ☐ Goliath Bird-Eating Spider
- ☐ Tropical Skimmer Dragonfly
- ☐ Jewel Beetle
- ☐ Army ants
- ☐ Titan Beetle
- ☐ Scorpion
- ☐ Archaeoprepone meander butterfly
- ☐ Mosquitoes
- ☐ Leaf Cutter ants

	
Scorpion	Goliath Bird-Eating Spider
	
Archaeoprepone meander butterfly	

		
Leaf Cutter Ant	Army Ants	Titan beetle <small>(There can grow to be more than 6 inches!)</small>
		
Tropical Skimmer Dragonfly	Bugs and Insects Macramyx saturalis	Mosquitoes

# Layers of the Rainforest Worksheets and Activities

Name: \_\_\_\_\_

## Rainforest Plants

An \_\_\_\_\_ is a plant that grows horizontally on other plants (such as a tree). They get water and nutrients from the \_\_\_\_\_ and sometimes from the debris that accumulates around it.

There are at least \_\_\_\_\_ types of epiphytes in rainforest around the world.

Many epiphytes are shaped to collect rainwater. A big one can hold up to \_\_\_\_\_ gallons!

Many different species of animals can live in one epiphyte (up to include frogs, lizards, snakes, beetles, dragonflies, ants, and even crabs).

Look: Upper Amazon Tree Frog found in the upper Amazon basin of Bolivia, Brazil, Colombia, Ecuador, and Peru. Its eggs are laid out of the water on leaves where the tadpoles develop in the water.

Left and below right: What are the climbing plants that use trees to climb up to the canopy called? \_\_\_\_\_

To the left: \_\_\_\_\_ plants support Amazonian trees in shallow soil.

Name: \_\_\_\_\_

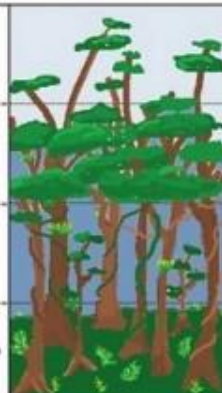

## Rainforest Layers

Which picture best represents each rainforest layer?

Answers

## Layers of the Rainforest

<b>Emergent</b>		Emergent layer is also known as the snail zone. This is the area with the tallest trees and plants. This layer is very windy. Birds and insects of this layer help pollinate the plants of the rainforest. Sloths and spider monkeys play in these trees. Hummingbirds, bats, snakes and other animals live in this layer.
<b>Canopy</b>		Canopy is the middle layer which includes branches, vines, and trees of different sizes. About 80% of the sunlight is absorbed in this layer. Most rainfall is captured by this layer as well. Food (fruit, seeds, etc.) is plentiful in this layer. Animals of this layer include squirrel monkeys, bats, snakes, tree frogs and toucans.
<b>Understory</b>		This layer is also called the shrub. It is not as wet here, so insects and mosquitoes thrive here. Common animals include bats, monkeys, snakes, lizards, jaguars, frogs, golden, birds, and others. Plants include mostly smaller trees, tree-lying shrubs, ferns, climbing plants and native bananas.
<b>Forest Floor</b>		Light in the ground layer and almost no sunlight reaches this part of the rainforest. Because it is dark and moist, things decay quickly here. Jaguars and tigers live here as well as insects, amphibians, reptiles, neotomys, army ants, and others. Very little vegetation can survive here, just low lying plants like ferns, moss, etc.

<b>Canopy</b>		
<b>Understory</b>		
<b>Forest Floor</b>		

## Descriptions of each layer.

Use the descriptions of each layer of the rainforest and place it into the page.

**Emergent**

The emergent layer is the top layer of the rainforest. It is the area with the tallest trees and plants. This layer is very windy. Birds and insects of this layer help pollinate the plants of the rainforest. Sloths and spider monkeys play in these trees. Hummingbirds, bats, snakes and other animals live in this layer.

**Canopy**

Canopy is the middle layer which includes branches, vines, and trees of different sizes. About 80% of the sunlight is absorbed in this layer. Most rainfall is captured by this layer as well. Food (fruit, seeds, etc.) is plentiful in this layer. Animals of this layer include squirrel monkeys, bats, snakes, tree frogs and toucans.

**Understory**

This layer is also called the shrub. It is not as wet here, so insects and mosquitoes thrive here. Common animals include bats, monkeys, snakes, lizards, jaguars, frogs, golden, birds, and others. Plants include mostly smaller trees, tree-lying shrubs, ferns, climbing plants and native bananas.

**Forest Floor**

Light in the ground layer and almost no sunlight reaches this part of the rainforest. Because it is dark and moist, things decay quickly here. Jaguars and tigers live here as well as insects, amphibians, reptiles, neotomys, army ants, and others. Very little vegetation can survive here, just low lying plants like ferns, moss, etc.

## Animals of the Rainforest

## **Average Rainfall Activity**

### **Tropical vs. Temperate Climates**

**We used a measuring tape to show the  
average rainfall of  
these different areas:**

**Avg. Rainfall in the Amazon**

**Avg. Rainfall in Temperate  
climates**

**Avg. Rainfall in various  
places around the U.S.**

Trees in the Rainforest grow to be almost twice as tall as trees in a temperate forest.

### What happens when people cut down rainforests for farms?

Any available nutrients are depleted quickly by farming. Furthermore, much of the top soil washes away because there are no plant roots to keep the soil in place.
